SMART CONTRACT AUDITING

HYPERSAFUU SMART CONTRACT AUDIT

March 21, 2022

INTRODUCTION

Client	HyperSafuu (HSAFUU)
Language	Solidity
Contract Address	0x6606823710E9DEdeBB062fC93b5A311f9e23Afb2
Decimals	9
Supply	1,000,000,000
Platform	Binance Smart Chain
Compiler	v0.6.12+commit.27d51765
Optimization	Yes, with 200 runs
Website	https://hypersafuu.io/
Telegram	https://t.me/HyperSafuu
Twitter	https://twitter.com/HyperSafuu

Description

HyperSafuu is an ecosystem app that provides both simplicity and security in trading crypt and NFTs at the lowest fees. offering a reliable and easy-to-use platform to access the broader crypto economy.

Summary	23

Approach

Audit Details

Our comprehensive audit report provides a full overview of the audited system's architecture, smart contract codebase, and details on any vulnerabilities found within the system.

Audit Goals

The audit goal is to ensure that the project is built to protect investors and users, preventing potentially catastrophic vulnerabilities after launch, that lead to scams and rugpulls.

Code Quality

Our analysis includes both automatic tests and manual code analysis for the following aspects:

- Exploits
 - Back-doors
 - Vulnerability
 - Accuracy
 - Readability
-

Tools

- Remix IDE
- MythX, Mytrhl
- SWC Registry
- Open Zeppelin Code Analyzer
- Solidity Code Complier

RISK CLASSIFICATION

CRITICAL

Issues on this level are critical to the smart contract's performance/functionality and should be fixed before moving to a live environment.

MEDIUM

Issues on this level could potentially bring problems and should eventually be fixed.

MINOR

Issues on this level are minor details and warning that can remain unfixed but would be better fixed at some point in the future

INFORMATIONAL

Information level is to offer suggestions for improvement of efficacy or security for features with a risk free factor.

ABSTRACT

Fees	Ownership	Mint function
Buy Fees: 14% Sell Fees: 14% *at audit time	Owned	No mint function found
Owner can set fees	Max Tx amount	Pause
Owner can set fees up to 100%	Owner can't set max Tx amount	Owner can't pause trading

Vulnerabilities Test

SWC ID	Description	
SWC-100	Function Default Visibility	Passed
SWC-101	Integer Overflow and Underflow	Passed
SWC-102	Outdated Compiler Version	Passed
SWC-103	FloatingPragma	Minor
SWC-104	Unchecked Call Return Value	Passed
SWC-105	Unprotected Ether Withdrawal	Passed
SWC-106	Unprotected SELF-DESTRUCT Instruction	Passed
SWC-107	Re-entrancy	Passed
SWC-108	State Variable Default Visibility	Passed
SWC-109	Uninitialized Storage Pointer	Passed
SWC-110	Assert Violation	Passed
SWC-111	Use of Deprecated Solidity Functions	Passed
SWC-112	Delegate Call to Untrusted Callee	Passed
SWC-113	DoS with Failed Call	Passed
SWC-114	Transaction Order Dependence	Passed
SWC-115	Authorization through tx.origin	Minor

SWC-116	Block values as a proxy for time	Passed
SWC-117	Signature Malleability	Passed
SWC-118	Incorrect Constructor Name	Passed
SWC-119	Shadowing State Variables	Passed
SWC-120	Weak Sources of Randomness from Chain Attributes	Passed
SWC-121	Missing Protection against Signature Replay Attacks	Passed
SWC-122	Lack of Proper Signature Verification	Passed
SWC-123	Requirement Violation	Passed
SWC-124	Write to Arbitrary Storage Location	Passed
SWC-125	Incorrect Inheritance Order	Passed
SWC-126	Insufficient Gas Griefing	Passed
SWC-127	Arbitrary Jump with Function Type Variable	Passed
SWC-128	DoS With Block Gas Limit	Passed
SWC-129	Typographical Error	Passed
SWC-130	Right-To-Left-Override control character (U+202E)	Passed
SWC-131	Presence of unused variables	Passed
SWC-132	Unexpected Ether balance	Passed
SWC-133	Hash Collisions With Multiple Variable Length Arguments	Passed
SWC-134	Message call with the hardcoded gas amount	Passed
SWC-135	Code With No Effects (Irrelevant/Dead Code)	Passed
SWC-136	Unencrypted Private Data On-Chain	Passed

MANUAL ANALYSIS

The contract is verified to check if functions do and work as they should and malicious code is not inserted.

	Tested	Result
Transfer	Yes	Passed
Total Supply	Yes	Passed
Buy Back	Yes	N/A
Burn	Yes	N/A
Mint	Yes	N/A
Rebase	Yes	N/A
Pause	Yes	N/A
Blacklist	Yes	Passed
Lock	Yes	N/A
Max Transaction	Yes	N/A
Transfer Ownership	Yes	Passed
Renounce Ownership	Yes	Passed

Symbol	Meaning
●	Function can modify state
\$	Function is payable
🔒	Private function
🔓	Internal function
NO!	Function has no modifier

INHERITANCE TREE

Inheritance is a feature of the object-oriented programming language. It is a way of extending the functionality of a program, used to separate the code, reduces the dependency, and increases the re-usability of the existing code. Solidity supports inheritance between smart contracts, where multiple contracts can be inherited into a single contract.

Important Snippets

Owner can set buy/sell fees up to 100%

```
function setBUSDRewardsFee(uint256 value) external onlyOwner{
    BUSDRewardsFee = value;
    totalFees = BUSDRewardsFee.add(liquidityFee).add(marketingFee).add(buybackFee);
}

function setLiquidityFee(uint256 value) external onlyOwner{
    liquidityFee = value;
    totalFees = BUSDRewardsFee.add(liquidityFee).add(marketingFee).add(buybackFee);
}

function setMarketingFee(uint256 _marketingFee) external onlyOwner{
    marketingFee = _marketingFee;
    totalFees = BUSDRewardsFee.add(liquidityFee).add(marketingFee).add(buybackFee);
}

function setBuybackFee(uint256 _buybackFee) external onlyOwner{
    buybackFee = _buybackFee;
    totalFees = BUSDRewardsFee.add(liquidityFee).add(marketingFee).add(buybackFee);
}
```

Owner can exclude from fees

```
function excludeFromFees(address account, bool excluded) public onlyOwner {
    require(_isExcludedFromFees[account] != excluded, "HSAFUU: Account is already the value of 'excluded'");
    _isExcludedFromFees[account] = excluded;

    emit ExcludeFromFees(account, excluded);
}
```

Owner can blacklist wallets

```
function blacklistAddress(address account, bool value) external onlyOwner{
    _isBlacklisted[account] = value;
}
```

Owner can exclude from dividends

```
function excludeFromDividends(address account) external onlyOwner{
    dividendTracker.excludeFromDividends(account);
}
```

GOOD PRACTICES ✓

- The owner cannot mint new tokens
- The owner cannot set max Tx amount
- The owner cannot stop or pause the smart contract
- The smart contract utilizes "SafeMath" to prevent overflows

```
library SafeMath {  
  
    function add(uint256 a, uint256 b) internal pure returns (uint256) {  
        uint256 c = a + b;  
        require(c >= a, "SafeMath: addition overflow");  
  
        return c;  
    }  
  
    function sub(uint256 a, uint256 b) internal pure returns (uint256) {  
        return sub(a, b, "SafeMath: subtraction overflow");  
    }  
  
    function sub(uint256 a, uint256 b, string memory errorMessage) internal pure returns (uint256) {  
        require(b <= a, errorMessage);  
        uint256 c = a - b;  
  
        return c;  
    }  
  
    function mul(uint256 a, uint256 b) internal pure returns (uint256) {  
        // Gas optimization: this is cheaper than requiring 'a' not being zero, but the  
        // benefit is lost if 'b' is also tested.  
        // See: https://github.com/OpenZeppelin/openzeppelin-contracts/pull/522  
        if (a == 0) {  
            return 0;  
        }  
  
        uint256 c = a * b;  
        require(c / a == b, "SafeMath: multiplication overflow");  
  
        return c;  
    }  
  
    function div(uint256 a, uint256 b) internal pure returns (uint256) {  
        return div(a, b, "SafeMath: division by zero");  
    }  
  
    function div(uint256 a, uint256 b, string memory errorMessage) internal pure returns (uint256) {  
        require(b > 0, errorMessage);  
        uint256 c = a / b;  
        // assert(a == b * c + a % b); // There is no case in which this doesn't hold  
  
        return c;  
    }  
  
    function mod(uint256 a, uint256 b) internal pure returns (uint256) {  
        return mod(a, b, "SafeMath: modulo by zero");  
    }  
  
    function mod(uint256 a, uint256 b, string memory errorMessage) internal pure returns (uint256) {  
        require(b != 0, errorMessage);  
        return a % b;  
    }  
}
```

DISCLAIMER

SafuAudit.com is not a financial institution and the information provided on this website does not constitute investment advice, financial advice, trading advice or any other sort of advice. You should not treat any of the website's content as such. Investing in crypto assets carries a high level of risk and does not hold guarantees for not sustaining financial loss due to their volatility.

Accuracy of Information

SafuAudit will strive to ensure accuracy of information listed on this website although it will not hold any responsibility for any missing or wrong information. SafuAudit provides all information as is. You understand that you are using any and all information available here at your own risk. Any use or reliance on our content and services is solely at your own risk and discretion.

The purpose of the audit is to analyse the on-chain smart contract source code, and to provide basic overview of the project.

While we have used all the information available to us for this straightforward investigation, you should not rely on this report only – we recommend proceeding with several independent audits. Be aware that smart contracts deployed on a blockchain aren't secured enough against external vulnerability, or a hack. Be aware that active smart contract owner privileges constitute an elevated impact to smart contract's safety and security. Therefore, SafuAudit does not guarantee the explicit security of the audited smart contract. The analysis of the security is purely based on the smart contracts alone. No applications or operations were reviewed for security. No product code has been reviewed.

AUDIT RESULTS

CRITICAL

No critical severity issues have been found.

MEDIUM

- Owner can set fees up to 100%, it should be restricted beyond a certain range

MINOR

- A floating pragma is set. It is recommended to specify a fixed compiler version to ensure that the bytecode produced does not vary between builds. This is especially important if you rely on bytecode-level verification of the code.
- Using "tx.origin" as a security control can lead to authorization bypass vulnerabilities. Consider using "msg.sender" instead.

INFORMATIONAL

The standard audit model does not offer suggestions and consulting for improvements of efficacy.

SCORE

Manual Analysis

Vulnerabilities

Contract Readability

Owner Privileges

Compiler Check

Final Score: 92.8

SUMMARY

Top 10 holders

Rank	Address	Quantity (Token)	Percentage
1	0x2492c3474dfeeb94c51a1994911157b286a0e319	1,000,000,000	100.0000%

Conclusion

Project HyperSafuu does not contain any severe issues.

SafuAudit has tested the security based on manual and automated tests.
Please note that we don't offer any warranties for business model.
